Quick Note

Data for the years 2020, 2021, and 2022 should be interpreted with caution due to the impact of the COVID-19 pandemic on access to HIV testing, care-related services, and case surveillance activities in state/local jurisdictions. Therefore, more time and data are needed to accurately assess COVID-19's impact on HIV disease in Pennsylvania (PA).

Definitions

New HIV diagnoses: refer to the number of individuals newly diagnosed with HIV disease within a specific time, typically one year. It is important to note that this number reflects diagnoses, not necessarily the number of new HIV disease. A person diagnosed with HIV may have acquired the virus months or even years prior to the diagnosis.

Late/concurrent diagnosis: A late HIV diagnosis is defined as having AIDS (stage 3) at the time of initial HIV disease diagnosis or being diagnosed with AIDS within 91 days (3 months) of initial diagnosis. Stage 3 (AIDS) classification is based on the first CD4 test performed or documentation of an AIDS-defining condition ≤ 3 months (≤ 91 days) after HIV diagnosis. People receive an AIDS diagnosis when their CD4 cell count drops below 200 cells per milliliter of blood, or they develop certain illnesses sometimes called opportunistic infections.

General Epidemiology Overview of HIV Disease in PA

An Overview of HIV Epidemiology in PA at Year-end 2024

- There has been a downward trend in the number of newly diagnosed HIV disease since the early 1990s with a dip in the year 2020 due to the COVID-19 pandemic.
- A total of 1,171 people were newly diagnosed with HIV disease in 2015 compared to 922 people in 2024.
- This represents a 21.3% decrease in the number of newly diagnosed HIV disease from year 2015 to 2024.
- In the last 5 years from 2020-2024, a total of 4,493 people were newly diagnosed with HIV and reported in PA.

Selected Characteristics of People Newly Diagnosed with HIV Disease in PA, 2020-2024 (N=4,493)

- By sex at birth, the number of newly diagnosed individuals that were females was 957 (21.3%) while 3,536 (78.7%) were males in the five-year period.
- Considering race/ethnicity among newly diagnosed individuals, 12 (0.2%) were AI/AN* and NHPI**, 75 were Asians (1.7%), 2,041 (45.4%) were Black/African American, 952 (21.2%) were Hispanic, 182 (4.1%) were individuals of multiple races, and 1,231 (27.4%) were white.

*AI/AN: American Indian or Alaska Native

**NHPI: Native Hawaiian or Other Pacific Islander

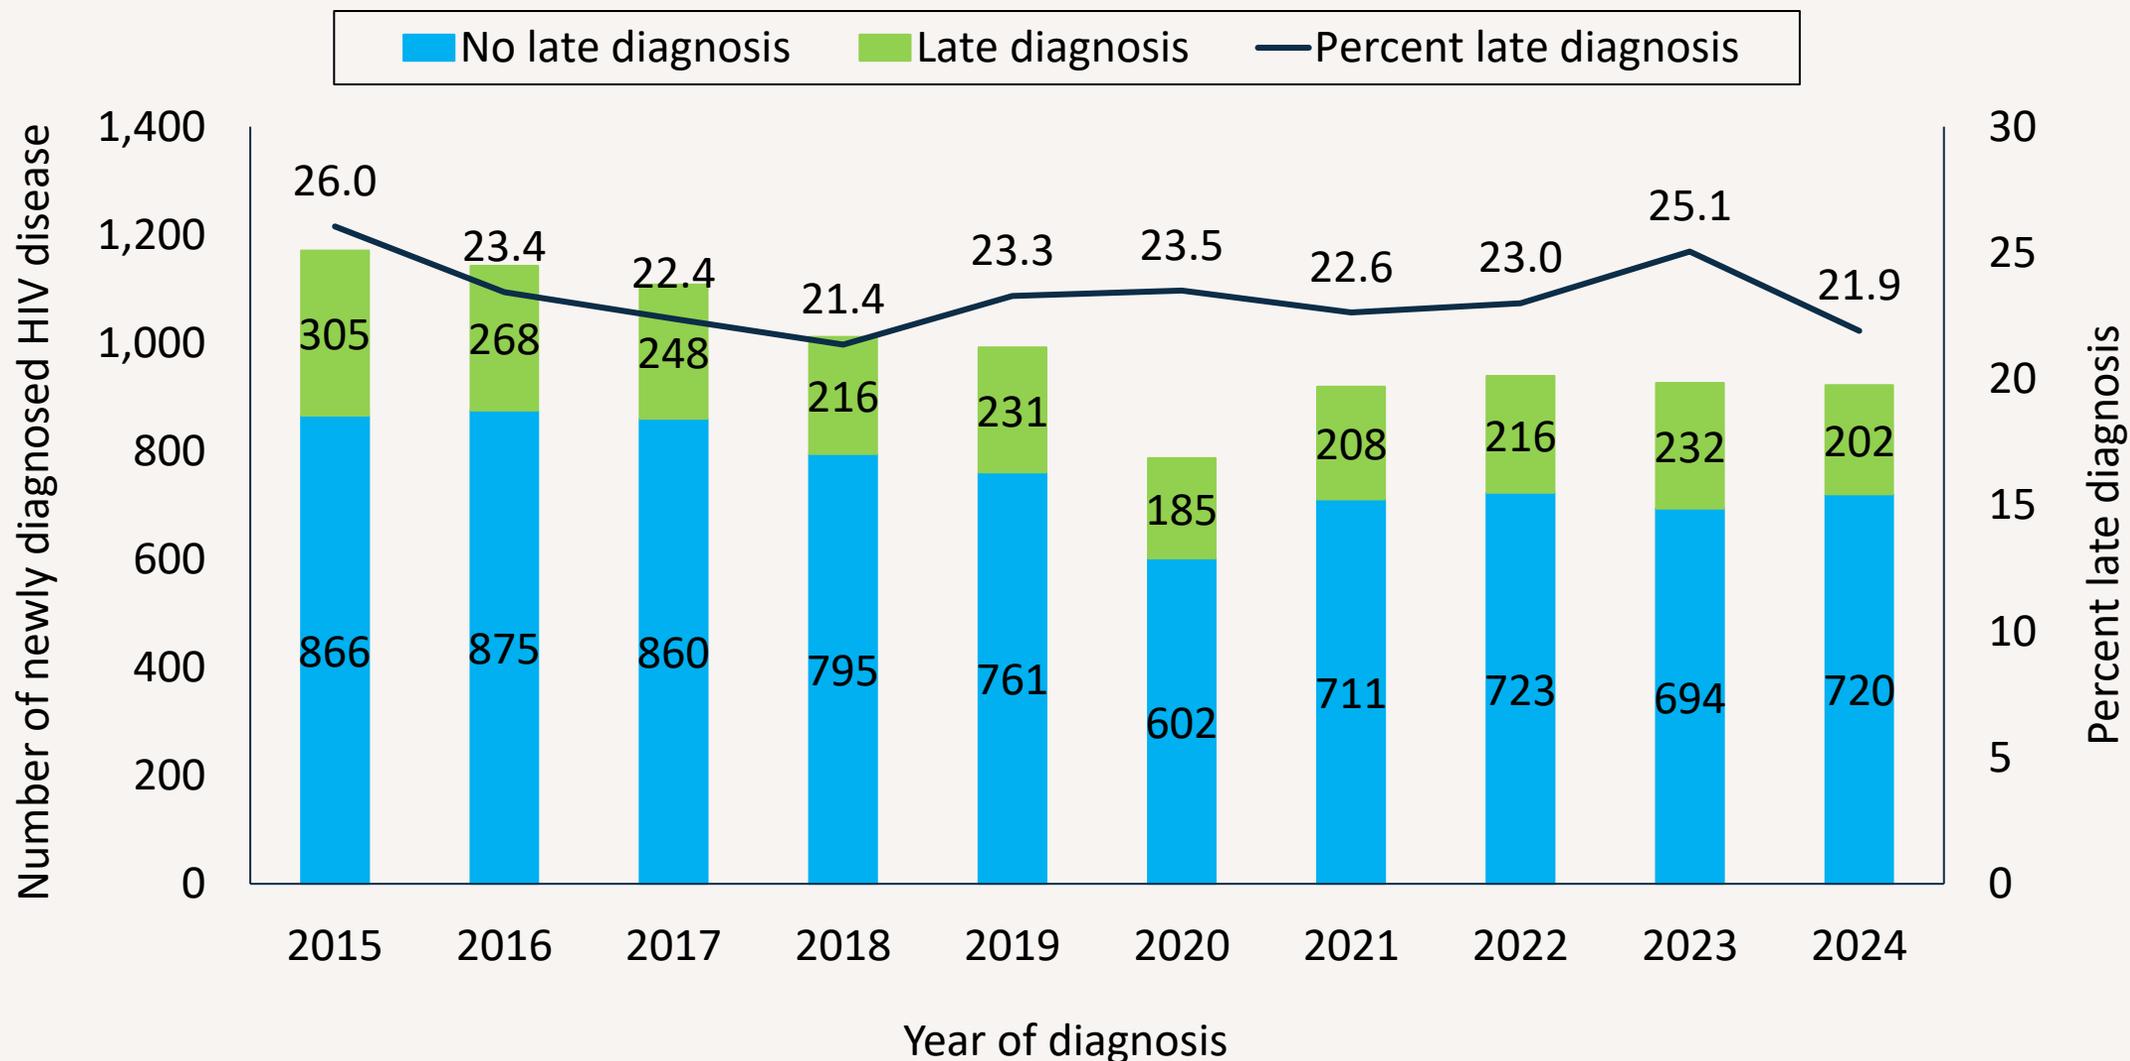

Selected Characteristics of People Newly Diagnosed with HIV Disease in PA, 2020-2024 (N=4,493)

- By mode of transmission, 2,363 (52.6%) of all newly diagnosed HIV individuals in the five-year period were men who have sex with men (MSM). Heterosexual contact accounted for 806 (17.9%) newly diagnosed HIV disease, 300 (6.7%) were injection drug use (IDU) related, 170 (3.8%) were MSM&IDU, 8 (0.2%) had pediatric mode, and 846 (18.8%) other/unknown transmission risk.
- By age at diagnosis, 9 (0.2%) were aged 0-14 years old, 844 (18.8%) were aged 15 to 24 years old, 1,679 (37.4%) were aged 25 to 34 years old, 981 (21.8%) were aged 35 to 44 years old, 536 (11.9%) were aged 45 to 54 years old, 341 (7.6%) were aged 55 to 64 years old , and 103 (2.3%) were aged 65 years and older.

Newly Diagnosed HIV Disease and Late HIV Diagnoses in the Aging Population (≥ 50 years of age) in PA

Selected Characteristics of People Newly Diagnosed with HIV Disease Aged 50 years and Older in PA, 2020-2024 (N=698)

- Out of the 4,493 people were newly diagnosed and reported in PA from 2020 to 2024, a total of 698 (15.5%) were aged 50 years and older at the time of diagnosis.
- Females accounted for 32.8% (229/698) and males were 67.2% (469/698) of people diagnosed with HIV aged 50 years and older at the time of diagnosis.
- By race/ethnicity, 1.6% (11/698) of all newly diagnosed HIV individuals in the five-year period were AI/AN and Asian, 44.7% (312/698) are Blacks/African Americans, 15.5% (108/698) were Hispanic, 2% (14/698) were of multiple races, and 36.2% (253/698) were white.
- By mode of transmission, 32.8% (229/698) of all newly diagnosed HIV individuals in the five-year period aged 50 years and older were men who have sex with men (MSM). Heterosexual contact accounted for 26.1% (182/698), 6.6% (46/698) were injection drug use (IDU) related, 2.7% (19/698) were MSM&IDU, and 31.8% (222/698) had other/unknown transmission risk.

Selected Characteristics of Late/Concurrent Diagnoses Among People Aged 50 years and Older in PA, 2020-2024 (N=286)

- A total of 1,043 people had late/concurrent HIV diagnosis and those aged 50 years and older accounted for 27.4% (286/1,043).
- Out of the 698 people aged 50 years and older at the time of diagnoses reported in PA from 2020 to 2024, a total of 286 (41%) were late/concurrent diagnosis.
- Females accounted for 32.5% (93/286) and males were 67.5% (193/286) of the late diagnoses.
- By race/ethnicity, 3.5% (10/286) Asian and individuals of multiple races, 43.7% (125/286) are Blacks/African Americans, 16.1% (46/286) were Hispanic, and 36.7% (105/286) were white.
- By mode of transmission, 30.1% (86/286) were men who have sex with men (MSM). Heterosexual contact accounted for 28.7% (82/286), 4.9% (14/286) were injection drug use (IDU) related, 3.1% (9/286) were MSM&IDU, and 33.2% (95/286) had other/unknown transmission risk.

Late Diagnosis Among People Aging With HIV in PA, 2020-2024

Year of diagnosis	Age at diagnosis	New diagnoses	Late diagnoses	Percent late diagnoses
		No.	No.	%

Summary

Summary

- About 1 in 5 individuals newly diagnosed with HIV in PA had a late diagnosis.
- Females and those who acquired HIV through heterosexual contact had a higher proportion of late diagnosis compared to males or MSM.
- Asians and individuals aged 55-64 at the time of diagnosis had a higher proportion of late diagnosis. So many factors including access to care, behavioral/social factors may be responsible for the proportions and differences observed.
- 19.9% of those aged 49 years old or less had a late HIV diagnosis compared to 41% among individuals aged 50 years and older.
- Counties that show that the proportion of those diagnosed in these counties during the 5-year period with late diagnosis at 23.2% or higher cuts across most counties, especially the rural counties bearing in mind that rural counties have smaller numbers of new diagnoses.
- Late diagnoses represent multiple missed opportunities to diagnose and treat HIV disease and to prevent transmission. Late HIV diagnosis is associated with poor outcomes, an increased risk of ongoing HIV transmission and high healthcare costs.

Recommendations

- Routine Screening
- Opt-Out Testing
- Targeted Testing
- Education and awareness
